PREVENT INSIDER THREATS
WITH USER ACTIVITY MONITORING

Insider threats represent a serious security blind-spot where an increasing number of security incidents stem. Highly publicized data theft, such as the recent insider breach by a financial advisor at Morgan Stanley or the AT&T call center incident, highlight the increasing need for improved security practices to reduce the risks posed by insider threats.

ObserveIT is a pioneer in user activity monitoring and the only company that provides user behavioral analytics, activity alerting and visual forensics to prevent insider threats. With ObserveIT's user activity monitoring you'll know when users put your business at risk. ObserveIT detects and alerts on application usage indicative of insider risks becoming insider threats. ObserveIT records and indexes all user activity, so you'll know what's happening in all applications, even applications that do not generate logs. You'll have a clear picture, literally, of all user actions across your entire enterprise including web apps, legacy applications, and custom or homegrown applications.

By alerting companies to suspicious behavior in real-time – and providing visual forensic evidence on exactly what happened – ObserveIT is uniquely able to help companies prevent the loss of sensitive corporate and customer information, and also satisfy compliance monitoring regulations for PCI, HIPAA, SOX, and ISO in minutes.

HOW IT WORKS

ObserveIT provides screen-recording technology to capture all user behavior, regardless of environment. Beyond providing video-like playback of all user activity, ObserveIT turns these screen recordings into User Activity Logs that can be easily searched, analyzed, audited and acted upon. Real-time alerts based on user actions inform administrators about suspicious and unusual activity, to operationalize forensic analysis and enable early detection and mitigation of insider threats.

MANAGING INSIDER SECURITY THREATS

RECORD WHO'S DOING WHAT

With ObserveIT, you will always know exactly who did what on company servers and desktops. ObserveIT records user activity in every application, Web page and system, regardless of how users gain access (RDP, SSH, Telnet, ICA, direct console login, etc.). ObserveIT records sessions in Citrix published applications, Citrix virtual desktops and VMware environments, as well as stand-alone Windows and Unix/Linux desktops and servers.

ANALYZE USER BEHAVIOR

ObserveIT dramatically shrinks the time to discover the "who, what, where, when" of security incidents and breaches from weeks or months to just minutes. ObserveIT continually analyzes user behavior to detect activities that are out of role, suspicious or in violation of security policies. Security teams can easily tailor alerts to their specific needs, using an intuitive and powerful analytic engine.

INVESTIGATE SUSPICIOUS ACTIVITY

ObserveIT makes it easy to investigate unusual or suspicious user behavior with searchable user activity logs and video-like playback of all sessions. Going far beyond simply visually recording on-screen activity, the software transcribes every session into an easy-to-read summary so that watching the session playback isn't necessary to know what the user did. Clicking on any particular event in the summary launches the video-like playback from that exact moment.

ADD USER CONTEXT TO YOUR SECURITY ECOSYSTEM

By integrating user context into existing architectures—SIEM, ITSM, identity & access solutions and others—companies significantly enhance their levels of security and visibility. ObserveIT has developed a number of bi-directional integrations to simplify the process of detecting and preventing insider threats.

A SELECTION OF OBSERVEIT CUSTOMERS

We have earned the trust of 1,200+ customers, including these fine companies:

SOCIETE GENERALE	Allianz	SAMSUNG	Coca-Cola	vodafone
BNP PARIBAS	ING	SIEMENS	xerox	FUJITSU
UBI Banca	BLACKROCK	Cisco WEBEX	SANOFI	T-Mobile
中国建设银行 China Construction Bank	UPS	BT	IBM	orange
